### ABSTRACT

In this paper we obtain norm estimates for the Carlson-Shaffer operator of functions defined on the class of uniformly convex functions of order  $\alpha$  and type  $\beta$  by using the Pre-Schwarzian norm given by  $\|f\| = \sup_{z \in \mathbb{U}} (1 - |z|^2) \left| \frac{f''(z)}{f'(z)} \right|$ .

**Keywords:** Pre-Schwarzian norm, Convex, Starlike, Analytic function, Subordination, Hadamard product, Hypergeometric function, Carlson-Shaffer operator.

بعض التطبيقات على فصل الدوال المحدبة بشكل منتظم والمرتبطة بنظم شوارتز والمعرفة باستخدام مؤثر كارلسون-شافير

### المخلص

في هذه الورقة، تحصلنا على التقديرات المعيارية للمؤثر كارلسون-شافير للدوال المعرفة على فصل الدوال المحدبة بشكل منتظم من الرتبة  $\alpha$  والنوع  $\beta$  باستخدام نظم شوارتز. الكلمات المفتاحية: نظم شوارتز، الدالة المحدبة، النجمية، التحليلية، التبعية التفاضلية، الضرب الالتفافي، الدالة فوق الهندسية، مؤثر كارلسون-شافير.

### 1. Introduction

Let  $\mathcal{H}$  be the space of analytic functions in the open unit disk  $\mathbb{U} = \{z \in \mathbb{C}: |z| < 1\}$  and  $\mathcal{H}_a = \{f \in \mathcal{H}: f(0) = a\}$ . Additionally, let  $\mathcal{A} = \mathcal{H}_1$ , meaning that a function  $f \in \mathcal{A}$  if

$$f(z) = z + \sum_{n=2}^{\infty} a_n z^n; (z \in \mathbb{U}), \quad (1.1)$$

and let  $\mathcal{b}$  be the subclass of  $\mathcal{H}$  consisting of all locally univalent functions, namely,  $\mathcal{b} = \{f \in \mathcal{H}: f'(z) \neq 0, z \in \mathbb{U}\}$ .

Following Hornich operation [1], we consider  $\mathcal{B}$  as a vector space over  $\mathbb{C}$ , and for  $f \in \mathcal{B}$ , we define

$$\|f\| = \sup_{z \in \mathbb{U}} (1 - |z|^2) \left| \frac{f''(z)}{f'(z)} \right|, \quad (1.2)$$

where  $f''/f'$  is the pre-Schwarzian derivative of  $f$ . For general properties of almost uniformly locally univalent functions relating the norm see [2], [3].

For functions  $f, g \in \mathcal{H}$ , we say that a function  $f$  is subordinat to a function  $g$ , and written  $f < g$ , if and only if there exists a function  $\omega$ , analytic in  $\mathbb{U}$  such that  $\omega(0) = 0$ ,  $|\omega(z)| < 1 (z \in \mathbb{U})$ , and  $f(z) = g(\omega(z)) (z \in \mathbb{U})$

In particular, if  $g$  is univalent in  $\mathbb{U}$ , then we have the following equivalence (see [4], [5]):

$$f(z) < g(z) \Leftrightarrow f(0) = g(0) \text{ and } f(\mathbb{U}) \subset g(\mathbb{U})$$

Also, the Hadamard product (or the convolution) of two analytic functions  $f$  and  $g$ , where  $f(z) = \sum_{n=0}^{\infty} a_n z^n$ , and  $g(z) = \sum_{n=0}^{\infty} b_n z^n$ , is defined as

$$(f * g)(z) = \sum_{n=0}^{\infty} a_n b_n z^n = (g * f)(z), (z \in \mathbb{U})$$

The subclasses of starlike and convex functions of order  $\alpha (0 \leq \alpha < 1)$  are represented by the notations  $\mathcal{S}^*(\alpha)$  and  $\mathcal{K}(\alpha)$  respectively. We denote  $\mathcal{S}^*(0) = \mathcal{S}^*$  and  $\mathcal{K}(0) = \mathcal{K}$ , the subclasses of starlike and convex functions, see for example (Srivastava and Owa [6]).

The classes  $UCV$  and  $UST$  of uniformly convex and uniformly starlike functions were first presented by Goodman[7], [8]. Rønning [9] provided a one variable analytic characterization for  $UCV$ , meaning that a function  $f(z)$  of the form (1.1) belongs to the class  $UCV$  if and only if

$$Re \left( 1 + \frac{zf''(z)}{f'(z)} \right) > \left| \frac{zf''(z)}{f'(z)} \right|; (z \in \mathbb{U}). \quad (1.3)$$

Goodman proved the classical Alexander's result  $f(z) \in UCV \Leftrightarrow zf'(z) \in UST$ , does not hold. On later Rønning [10] introduced the class  $\mathcal{S}_p$  which consists of functions such that  $f(z) \in UCV \Leftrightarrow zf'(z) \in \mathcal{S}_p$ . Also, in the follwing Rønning[9], [10] introduce a parameter  $\alpha$  to generalized the classes  $UCV$  and  $\mathcal{S}_p$ .

**Definition 1.1.** A function  $f(z)$  of the form (1.1) is said to be in the class  $\mathcal{S}_p(\alpha)$ , if it satisfies the condition:

$$Re \left( \frac{zf'(z)}{f(z)} \right) > \left| \frac{zf'(z)}{f(z)} - 1 \right| + \alpha; (-1 \leq \alpha < 1, z \in \mathbb{U}). \quad (1.4)$$

The class of uniformly convex functions of order  $\alpha$  denoted by  $UCV(\alpha)$ , is indicated  $f(z) \in \mathcal{A}$  such that  $zf'(z) \in \mathcal{S}_p(\alpha)$ .

Bharati ,Parvatham and Swaminathan also presented the classes  $UCV(\alpha, \beta)$  and  $\mathcal{S}_p(\alpha, \beta)$  in [11]as follows:

**Definition 1.2.** A function  $f(z)$  of the form (1.1) is said to be in the class  $UCV(\alpha, \beta)$ , if it satisfies the condition:

$$Re \left( 1 + \frac{zf''(z)}{f'(z)} \right) > \beta \left| \frac{zf''(z)}{f'(z)} \right| + \alpha; (0 \leq \alpha < 1, \beta \geq 0, z \in \mathbb{U}). \quad (1.5)$$

**Definition 1.3.** A function  $f(z)$  of the form (1.1) is said to be in the class  $\mathcal{S}_p(\alpha, \beta)$ , if it satisfies the condition:

$$Re \left( \frac{zf'(z)}{f(z)} \right) > \beta \left| \frac{zf'(z)}{f(z)} - 1 \right| + \alpha; (0 \leq \alpha < 1, \beta \geq 0, z \in \mathbb{U}). \quad (1.6)$$

Moreover,  $f(z) \in UCV(\alpha, \beta)$  if and only if  $zf'(z) \in \mathcal{S}_p(\alpha, \beta)$ .

For complex parameters  $a_1, a_2, \dots, a_q$  and  $b_1, b_2, \dots, b_s (b_j \notin \mathbb{Z}_0^- = \{0, -1, -2, \dots\}; j = 1, 2, \dots, s)$ , the generalized hypergeometric function  ${}_qF_s(a_1, \dots, a_q; b_1, \dots, b_s; z)$  is defined by the following series (see [12]):

$${}_qF_s(a_1, \dots, a_q; b_1, \dots, b_s; z) = \sum_{n=2}^{\infty} \frac{(a_1)_n \dots (a_q)_n}{(b_1)_n \dots (b_s)_n (1)_n} z^n \quad (1.7)$$

where  $q \leq s + 1; q, s \in \mathbb{N}_0 = \{0, 1, 2, \dots\}; z \in \mathbb{U}$  and  $(\lambda)_n$  is the Pochhammer symbol defined in terms of the Gamma function by

$$(\lambda)_n = \frac{\Gamma(\lambda + n)}{\Gamma(\lambda)} = \begin{cases} 1; & n = 0 \\ \lambda(\lambda + 1)(\lambda + 2) \dots (\lambda + n - 1); & n \in \mathbb{N} \end{cases}$$

Dziok and Srivastava [13], [14] considered a linear operator  ${}_qH_s(a_1, \dots, a_q; b_1, \dots, b_s; z): \mathcal{A} \rightarrow \mathcal{A}$  defined by the following Hadamard product (or convolution):

$$\begin{aligned} {}_qH_s(a_1, \dots, a_q; b_1, \dots, b_s; z)f(z) &= z {}_qF_s(a_1, \dots, a_q; b_1, \dots, b_s; z) * f(z) \\ &= z + \sum_{n=2}^{\infty} \frac{(a_1)_{n-1} \dots (a_q)_{n-1}}{(b_1)_{n-1} \dots (b_s)_{n-1} (1)_{n-1}} a_n z^n \end{aligned} \quad (1.8)$$

For  $q = 2, s = 1, b = 1$  we obtain the Carlson-Shaffer operator defined as (see[6], [15])

$$\begin{aligned} \mathcal{L}(a, c)f(z) &= {}_2H_1(a, 1; c, z)f(z) \\ (1.9) &= z {}_2F_1(a, 1; c; z) * f(z) \end{aligned}$$

$$= \frac{\Gamma(c)}{\Gamma(a)\Gamma(c-a)} \int_0^1 t^{a-2} (1-t)^{c-a-1} f(tz) dt$$

If  $f(z) \in \mathcal{A}$ , then we can write (1.9) as follows:

$$\begin{aligned} \mathcal{L}(a, c)f(z) &= z {}_2F_1(a, 1; c; z) * f(z) \\ &= \left( z + \sum_{n=2}^{\infty} \frac{(a)_{n-1}}{(c)_{n-1}} z^n \right) * f(z) \\ &= z + \sum_{n=2}^{\infty} \frac{(a)_{n-1}}{(c)_{n-1}} a_n z^n \end{aligned} \quad (1.10)$$

and  $z(\mathcal{L}(a, c)f)'(z) = a\mathcal{L}(a+1, c)f(z) - (a-1)\mathcal{L}(a, c)f(z) (z \in \mathbb{U})$ .

We notice that

$$\mathcal{L}(a, a)f(z) = f(z), \quad \mathcal{L}(2, 1)f(z) = zf'(z)$$

For simplicity, we write  ${}_2F_1(a, 1; c; z) = F(a, 1; c; z)$ . For  $F(a, 1; c; z)$ , we have well known derivative formula

$$F'(a, 1; c; z) = \frac{d}{dz} F(a, 1; c; z) = \frac{a}{c} F(a+1, 2; c+1; z) \quad (1.11)$$

## 2. Preliminaries

Each of the following results will be needed to proof our results:

**Lemma 2.1.** [16]. Let  $\psi(z) \in \mathcal{H}_1$  be starlike univalent function with respect to  $\psi(0) = 1, \operatorname{Re}\{\psi(z)\} > 0, z \in \mathbb{U}$ , and suppose that  $g(z) \in \mathcal{A}$  satisfies the equation

$$1 + \frac{zg''(z)}{g'(z)} = \psi(z), (z \in \mathbb{U}).$$

Then for  $f \in \mathcal{A}$ , the condition  $1 + \frac{zg''(z)}{g'(z)} < \psi(z)$ , implies that  $f'(z) < g'(z)$ .

**Lemma 2.2.** [17]. Let  $a, b, c$  be non zero real numbers with  $0 < a \leq c, a \leq 1$ . Then the function  $zF(a, 1; c; z)$  is starlike of order  $1 - \frac{a}{2}$ .

**Corollary 2.1.** Suppose that  $a, b, c$  be non zero real numbers with  $-1 < a \leq 1, a \leq c$ . Then the function  $F(a, 1; c; z)$  is convex.

**Lemma 2.3.** [18] Let  $f, g \in \mathcal{H}$  be a convex function such that  $f < g$ . Then for all convex functions  $h \in \mathcal{H}$ , we have  $h * f < h * g$ .

**Lemma 2.4.** [19]. If  $f \in \mathcal{K}, g \in \mathcal{S}^*$ , then for each function  $h$  in  $\mathcal{A}$ , we have  $\frac{(f*hg)(\mathbb{U})}{(f*g)(\mathbb{U})} \subseteq \overline{co}h(\mathbb{U})$ , where  $\overline{co}h(\mathbb{U})$  denotes the closed convex hull of  $h(\mathbb{U})$ .

## 3. Results Involving Carlson-Shaffer Operator

**Theorem3.1.** [21] Let  $f, g \in \mathcal{A}$ ,  $g'$  is convex in  $\mathbb{U}$  and  $0 < a \leq c$ ,  $a \leq 1$ . If  $f' < g'$ , then  $\|f\| \leq \|g\|$  and  $\|\mathcal{L}(a, c)f(z)\| \leq \|\mathcal{L}(a, c)g(z)\|$ .

Proof. Given that  $f'(z) < g'(z)$ , then by applying subordination definition, there exists a  $\omega$  function analytic in  $\mathcal{A}$  with  $\omega(0) = 0$  and  $|\omega(z)| < 1$ , such that  $f'(z) = g'(\omega(z))$  ( $z \in \mathbb{U}$ ).

Additionally, for the Schwarz function  $\omega$  we have  $|\omega(z)| \leq |z|$ , that is,

$$(1 - |z|^2)|\omega'(z)| \leq 1 - |\omega(z)|^2, (z \in \mathbb{U}),$$

Thus, we have  $\|f\| = \sup_{z \in \mathbb{U}} \left[ (1 - |z|^2) |\omega'(z)| \left| \frac{g''(\omega(z))}{g'(\omega(z))} \right| \right] \leq \sup_{z \in \mathbb{U}} \left[ (1 - |\omega(z)|^2) \left| \frac{g''(\omega(z))}{g'(\omega(z))} \right| \right]$

$$= \sup_{\xi \in \omega(\mathbb{U})} \left[ (1 - |\xi|^2) \left| \frac{g''(\xi)}{g'(\xi)} \right| \right] \leq \sup_{\xi \in \mathbb{U}} \left[ (1 - |\xi|^2) \left| \frac{g''(\xi)}{g'(\xi)} \right| \right] = \|g\|,$$

that completes the proof of the first part. To prove the second part, it is enough to show that  $(\mathcal{L}(a, c)f(z))' < (\mathcal{L}(a, c)g(z))'$ . The function  $g'(z)$  is convex (from the theorem) and also  $F(a, 1; c; z)$  (from Corollary 2.1). Thus, according to Lemma 2.3, we have

$$F(a, 1; c; z) * f'(z) < F(a, 1; c; z) * g'(z),$$

which implies that

$$(\mathcal{L}(a, c)f(z))' < (\mathcal{L}(a, c)g(z))'.$$

Therefore, we complete the proof of Theorem 3.1.  $\square$

**Theorem 3.2.** [21] Let  $0 < a \leq c$ ,  $a \leq 1$  and  $f(z) \in UCV(\alpha, \beta)$  ( $0 \leq \beta < \alpha < 1$ ,  $\frac{1}{2} \leq \frac{\alpha - \beta}{1 - \beta} < 1$ ), then for Carlson-Shaffer operator, we have

$$\|\mathcal{L}(a, c)f(z)\| \leq \frac{2a}{c} \left( \frac{1 - \alpha}{1 - \beta} \right) \sup_{0 \leq x < 1} (1 - x^2) \frac{{}_3F_2(a+1, 2, \frac{3-\beta-2\alpha}{1-\beta}; c+1, 2; x)}{{}_3F_2(a, 1, \frac{2(1-\alpha)}{1-\beta}; c, 1; x)}.$$

Proof. Given that  $f(z) \in UCV(\alpha, \beta)$ , then

$$\operatorname{Re} \left( 1 + \frac{zf''(z)}{f'(z)} \right) > \beta \left| \frac{zf''(z)}{f'(z)} \right| + \alpha,$$

that is,

$$\operatorname{Re} \left( 1 + \frac{zf''(z)}{f'(z)} \right) > \frac{\alpha - \beta}{1 - \beta} \equiv \gamma; (z \in \mathbb{U}),$$

or, equivalently,

$$1 + \frac{zf''(z)}{f'(z)} < \frac{1 + (1 - 2\gamma)z}{1 - z} = \varphi(z); (z \in \mathbb{U}), \quad (3.1)$$

where  $\varphi(z)$  is a convex function and therefore starlike with respect  $\varphi(z) = 1$ . Let  $g(z) \in \mathcal{A}$  be such that

$$1 + \frac{zg''(z)}{gf'(z)} = \frac{1 + (1 - 2\gamma)z}{1 - z} = \varphi(z); (z \in \mathbb{U}).$$

Then, by Lemma 2.1, we conclude that  $f'(z) < g'(z)$ .

After some computations, we have

$$\begin{aligned} g'(z) &= (1 - z)^{2(\gamma-1)} = \sum_{n=0}^{\infty} \frac{(2 - 2\gamma)_n}{(1)_n} z^n \\ &= F(2 - 2\gamma, 1; 1; z); (z \in \mathbb{U}). \end{aligned}$$

Since  $\frac{1}{2} \leq \gamma < 1$ , by using Corollary 2.1, the function  $g'(z)$  is convex. To find estimation of  $\|\mathcal{L}(a, c)f(z)\|$ , it is enough from Theorem 2.1 to obtain an estimation of  $\|\mathcal{L}(a, c)g(z)\|$ . Since

$$\begin{aligned} (\mathcal{L}(a, c)g)'(z) &= F(a, 1; c; z) * g'(z) \\ &= F(a, 1; c; z) * F(2 - 2\gamma, 1; 1; z) \\ &= {}_3F_2(a, 1, 2 - 2\gamma; c, 1; z) \\ (\mathcal{L}(a, c)g)''(z) &= \frac{a(2 - 2\gamma)}{c} {}_3F_2(a + 1, 2, 3 - 2\gamma; c + 1, 2; z) \end{aligned}$$

and

$$\left| \frac{{}_3F_2(a + 1, 2, 3 - 2\gamma; c + 1, 2; z)}{{}_3F_2(a, 1, 2 - 2\gamma; c, 1; z)} \right| \leq \frac{{}_3F_2(a + 1, 2, 3 - 2\gamma; c + 1, 2; |z|)}{{}_3F_2(a, 1, 2 - 2\gamma; c, 1; |z|)},$$

by Mathematic, we have

$$\left| \frac{(\mathcal{L}(a, c)g)''(z)}{(\mathcal{L}(a, c)g)'(z)} \right| \leq \frac{(\mathcal{L}(a, c)g)''(|z|)}{(\mathcal{L}(a, c)g)'(|z|)} (z \in \mathbb{U}).$$

Thus, we conclude that

$$\begin{aligned} \|\mathcal{L}(a, c)g(z)\| &= \sup_{z \in \mathbb{U}} (1 - |z|^2) \frac{|(\mathcal{L}(a, c)g)''(z)|}{|(\mathcal{L}(a, c)g)'(z)|} \\ &= \sup_{z \in \mathbb{U}} (1 - |z|^2) \frac{(\mathcal{L}(a, c)g)''(|z|)}{(\mathcal{L}(a, c)g)'(|z|)} \\ &= \frac{a(2 - 2\gamma)}{c} \sup_{z \in \mathbb{U}} (1 - |z|^2) \frac{{}_3F_2(a + 1, 2, 3 - 2\gamma; c + 1, 2; |z|)}{{}_3F_2(a, 1, 2 - 2\gamma; c, 1; |z|)}, \end{aligned}$$

this completes the proof of Theorem 3.2.  $\square$

**Theorem 3.3.** [20], [21] If  $f(z) \in \mathcal{S}^*$ ,  $a > 0$ ,  $c > a + 3$  and

$$\frac{\Gamma(c)\Gamma(c - a - 1)}{\Gamma(c - a)\Gamma(c - 1)} \left[ 1 + \frac{3a}{(c - a - 2)} + \frac{2(a)_2}{(c - a - 3)_2} \right] \leq 2, \quad (3.2)$$

then  $\mathcal{L}(a, c)f(z) \in \mathcal{S}^*$ .

Proof. Assuming  $f \in \mathcal{S}^*$  i.e.

$$\operatorname{Re} \left( \frac{zf'(z)}{f(z)} \right) > 0; (z \in \mathbb{U}). \quad (3.3)$$

Additionally, we have

$$\begin{aligned} \frac{z(\mathcal{L}(a, c)f(z))'}{(\mathcal{L}(a, c)f(z))} &= \frac{z(zF(a, 1; c; z) * f(z))'}{zF(a, 1; c; z) * f(z)} = \frac{zF(a, 1; c; z) * zf'(z)}{zF(a, 1; c; z) * f(z)} \\ &= \frac{zF(a, 1; c; z) * \frac{zf'(z)}{f(z)} f(z)}{zF(a, 1; c; z) * f(z)} = \frac{zF(a, 1; c; z) * H(z) f(z)}{zF(a, 1; c; z) * f(z)} \end{aligned}$$

Using the result of [22], we have  $zF(a, 1; c; z) \in \mathcal{K}$ , also  $f(z) \in \mathcal{S}^*$  by the hypothesis of the theorem. Thus, from Lemma 2.4,

$$\frac{z(\mathcal{L}(a, c)f(z))'}{\mathcal{L}(a, c)f(z)} \in \overline{co}H(\mathbb{U}); (z \in \mathbb{U}),$$

and by (3.3), we obtain  $\mathcal{L}(a, c)f(z) \in \mathcal{S}^*$ , which proves Theorem 3.3.  $\square$

**Theorem 3.4.** [20], [21] Let  $a > 0, c > a + 3$  such that the condition (3.2) holds. If  $f \in \mathcal{K}$ , then  $\mathcal{L}(a, c)f(z) \in \mathcal{K}$ .

Proof. Assuming  $f \in \mathcal{K}$ , it follows that

$$Re \left( 1 + \frac{zf''(z)}{f'(z)} \right) > 0; (z \in \mathbb{U}). \quad (3.4)$$

Furthermore, we have

$$\begin{aligned} 1 + \frac{z(\mathcal{L}(a, c)f(z))''}{(\mathcal{L}(a, c)f(z))'} &= 1 + \frac{F(a, 1; c; z) * zf''(z)}{F(a, 1; c; z) * f'(z)} \\ &= \frac{F(a, 1; c; z) * (zf''(z) + f'(z))}{F(a, 1; c; z) * f'(z)} \\ &= \frac{zF(a, 1; c; z) * \left( 1 + \frac{zf''(z)}{f'(z)} \right) zf'(z)}{zF(a, 1; c; z) * zf'(z)} = \frac{zF(a, 1; c; z) * G(z)\{zf'(z)\}}{zF(a, 1; c; z) * zf'(z)} \end{aligned}$$

Since  $zF(a, 1; c; z) \in \mathcal{K}$  and  $f \in \mathcal{K}$ , then using the Alexander theorem,  $zf'(z) \in \mathcal{S}^*$  and from Lemma 2.4, we obtain

$$1 + \frac{z(\mathcal{L}(a, c)f(z))''}{(\mathcal{L}(a, c)f(z))'} \in \overline{co}G(\mathbb{U}); (z \in \mathbb{U}).$$

By (3.4),  $\mathcal{L}(a, c)f(z) \in \mathcal{K}$  which ends the proof of Theorem 3.4.  $\square$

**Theorem 3.5.** [20], [21] Let  $a > 0, c > a + 3$  such that the condition (3.2) holds. If  $f$  is close to convex with respect to  $g$ , then  $\mathcal{L}(a, c)f(z)$  is close to convex with respect to  $\mathcal{L}(a, c)g(z)$ .

Proof. Assuming  $f$  is close to convex with respect to  $g$ , i.e

$$Re \left( \frac{zf'(z)}{g(z)} \right) > 0; (z \in \mathbb{U}). \quad (3.5)$$

Further, we have

$$\frac{z(\mathcal{L}(a, c)f(z))'}{\mathcal{L}(a, c)g(z)} = \frac{z(zF(a, 1; c; z) * f(z))'}{zF(a, 1; c; z) * g(z)} = \frac{z(F(a, 1; c; z) * f'(z))}{zF(a, 1; c; z) * g(z)}$$

$$\begin{aligned} &= \frac{zF(a, 1; c; z) * zf'(z)}{zF(a, 1; c; z) * g(z)} = \frac{zF(a, 1; c; z) * \frac{zf'(z)}{g(z)} g(z)}{zF(a, 1; c; z) * g(z)} \\ &= \frac{zF(a, 1; c; z) * M(z)g(z)}{zF(a, 1; c; z) * g(z)} \end{aligned}$$

Because of  $zF(a, 1; c; z) \in \mathcal{K}$  and  $g \in \mathcal{S}^*$ , Lemma 2.4 gives us

$$\frac{z(\mathcal{L}(a, c)f(z))'}{\mathcal{L}(a, c)g(z)} \in \overline{co}M(\mathbb{U}); (z \in \mathbb{U}),$$

and according to (3.5), we obtain the required result of Theorem 3.5.  $\square$

### Conclusion

In the present paper, we have obtained the norm estimates for Carlson-Shaffer operator of the class of uniformly convex functions of order  $\alpha$  and type  $\beta$  in light of the Pre-Schwarzian norm.
